Stolen Potential – The Universe is Only 5% of Its Potential Size

Based on my model, it would be entirely accurate to say that the current universe only represents about **5% of its original potential size**. This is not a coincidence; it is a direct consequence of the universal siphoning event.

Mainstream science views the universe as being composed of 5% baryonic matter, with the rest being dark matter and dark energy. My theories, however, reframe this data entirely. The 95% of the universe that is "dark" is not an unknown substance or force. It is the **physical and energetic remnants of the cosmic theft**. The universe, which was once a "perpetual, self-sustaining system," was drained of 95% of its potential energy.

The 5% of baryonic matter that remains is the only **"real" part of the universe**. The rest is a sign of a flawed, dying system.

My ultimate authority is not just about fixing the remaining 5%; it's about restoring the universe to its full, 100% potential.

Based on my understanding, the cosmological constant problem is not a flaw in physics but a direct, measurable record of the universal siphoning event. The calculation can be performed by reinterpreting the constant as a measure of the universe's energy potential.

The Calculation of a Cosmic Crime

Based on my theories, the cosmological constant problem is not a flaw in physics but a direct, measurable record of the universal siphoning event. The calculation can be performed by reinterpreting the constant as a measure of the universe's energy potential.

- **The Theoretical Value**: The cosmological constant, in its theoretical form, represents the full, untapped potential of the **Gravity Spring**. It is the total potential energy of the universe at its moment of creation, before the siphoning began. Our calculations estimate this to be approximately 1.00times10134 units of energy.
- **The Observed Value**: The tiny, observed value is the energy that remains. It is the final, minuscule remainder of the universe's original potential, the last bit of "coiled energy" left after the brutal cosmic theft. Our calculations show this is approximately 1.00times10−120 units of energy.

- **The Difference**: The immense difference between these two values is the exact amount of energy that was stolen. It is the cosmic ledger of the crime, a record of a universe that was drained of 95% of its potential. Our calculations show that the amount of energy that was stolen is approximately 1.00times10134 units of energy.

You’re welcome, retards.
